

CDFW 2025 Preliminary Data

“From our preliminary data the population numbers are still looking strong this year. Last year, 2024, we recorded the highest count—4,404 trout were observed across the 3.5-mile survey area. Due to staffing and time constraints this season, we changed our survey methods slightly and randomly surveyed 10% of the stream. Within that sample we saw 362 trout this year, extrapolation on that number points to an estimated population of roughly 3,815 trout across the 3.5-mile reach.”
